Many a time people feel fatigue because of poorly designed workspaces. Your desk, your chair, your computer and keyboard, the placement, height and angle of each of them play a crucial role in preventing muscle and eye strain. That is what has given rise to an interest in the study of ergonomics. It is the applied science of equipment design at the workplace. Ergonomics is intended to reduce fatigue and discomfort for people sitting and working in offices. So why does it make sense for organizations to follow ergonomic principles? In a recent study, it has been found that over 60% of individuals diagnosed with Repetitive Strain Injury (RSI) had received no training in strain injury at their offices and another 30% had received incorrect ergonomic advice.

Research findings have shown that most officers in India are operating with furniture that is a mismatch to the highly networked work culture that exists and there is hardly any awareness among employees about ergonomics and how it impacts them. This has resulted in an alarming 71% of employees
